As a registered user I want to be able to log in to a website so that I can make an appointment.

1. User can log in only if login and password are valid.
2. System has to show a message "Invalid email or password" after entering invalid data in either "Login" or/and "Password" fields.
3. System has to save user's login after log in with valid data and turned toggle button "Remember me".

As a patient I want to be able to make an appointment on the website so that I can do it whenever I need to.

1. The form contains information about appointments.
2. Only one user can make an appointment in specific time.
3. Booked time is enabled to be clicked on.
4. If while making an appointment specific time has been already booked, system shows a message "Something went wrong. Try again"
